KESSEL ModBus RTU Protocol

KESSEL

1   Description Modbus

Configuration mode

The Modbus implemented in the KESSEL control unit follows the Modbus standard with the Modbus/RTU protocol. The transmission mode (stop bit, parity, baud rate) can be freely set. The number of data bits are specified as 8 and cannot be changed.

The device address can be freely set between 1 and 247. A message to all devices (broadcast) within a Modbus network is not supported.

The Modbus can be used to query (read mode) and write (write mode) control unit values. A combination of write and read modes can be used, for example, to trigger a scan of the SonicControl sensor and to read out the determined values.

The following Modbus functions are released for use in the KESSEL control unit:

Code	Modbus function	Register	Cluster
01$_H$	Read COIL status	00001 - 09999	Contains information about all the control unit's digital outputs
02$_H$	Read discrete input	10001 - 19999	Contains information about all the control unit's digital inputs
04$_H$	Read INPUT register	30001 - 39999	Contains general information (numerical values, revision index, etc.) about the control unit
03$_H$	Read HOLDING register	40001 - 49000	Contains general digital information (errors and events) for the control unit
06$_H$	Write HOLDING register	49001 - 49999	Instruction register to write commands to the control unit

Data values and types transmitted

The information described in the register tables can be one of 4 different data types and has to be interpreted according to this type.

The 4 types are Boolean (digital) value, enumeration, numerical value and time values (dates, times, etc.).

Specific features may occur within the 4 different types; these are also described in more detail.

⇨ Boolean value (digital values)

- Values are either 0 or 1

- Values are transmitted as an individual bit

- They describe states (errors, events, digital outputs and inputs (COIL))

- Digital states for errors and digital outputs and inputs are displayed permanently (e.g. battery error) as long as they are pending.

- In the case of events, the states (0: event has not taken place; 1: event has taken place) are saved in the control unit until they have been queried via the Modbus, then they are deleted (e.g. maintenance done).

⇨ Enumeration

- Enumeration values display the selected setting (e.g. Language --> see tables) in accordance with their numerical value

⇨ Numerical value

- Numerical values must be converted in accordance with the specified values for factor and offset
- The equation for calculating the numerical values is:

  Current value = transmitted value × factor - offset

- A more detailed description can be found in chapter Numerical values.

⇨ Time values

- Date values are transmitted as numerical values since 01.01.2000 (i.e. number of days since 01.01.2000)

  1 = 01.01.2000

  2 = 02.01.2000

  3 = 03.01.2000

  etc.

  - Currently only 2 date values are transmitted --> last and next maintenance

- Times are transmitted as numerical values starting from 0:00 hours

  - 1 = 0:01 hours
  - 365 = 6:05 hours
  - 1387 = 23:07 hours

The maximum time is 23:59 hours and has the numerical value 1439.

KESSEL

2   Functions

2.1   Numerical values

2.1.1   Transmission of values

All possible data types have to be taken into account when transferring numerical values from or to the control unit via the Modbus. This includes, amongst other things, the following differentiations between integer or rational, positive or negative, large or small number range.

In order to do justice to this procedure, only integer, positive values should be transmitted when configuring the ModBus. As a result, values that are not integer and/or that are negative have to be converted so that they can be transmitted as integer, positive value. Once the values have been transmitted, they have to be converted back into their original form so that they can be shown correctly.

An offset (conversion of negative values) and a factor (conversion of the rational share) have to be specified for every value when these converting the values.

In addition, pay attention to the ModBus limitations during the transmission of values. Registers are used for transmissions on the Modbus. A register is hereby always 16 bits in size.

Since some values that have to be transmitted are (much) larger and 16 bits are not enough for the transmission, these values have to be split over 2 (or more) registers.

Some values are much smaller and need no more than 8 bits for the transmission. These values should always be transmitted as 8 bits and are combined into one register.

The transmission values are currently 8 bits, 16 bits and 32 bits.

2.1.2   Value calculation in the control unit

Description

Since only integer, positive numerical values can be transmitted, all other values have to be adjusted to meet these criteria.

The values in the control unit must be converted in accordance with the specified factor and offset according to the following equation:

transmitted value = (value - offset) / factor

Example

This example shows how the value -10,531.4 has to be converted before it can be transmitted.

In principle, the value -10,531.4 lies between -32,768 and 32,767 and could be transmitted in a value range with an algebraic sign. The rational share - 0.4 - would then be lost.

So as to be able to transmit the value -10,531.4, it first has to be converted in the control unit.

The **factor 0.1** and the **offset -30,000** shall apply for the specified value.

Transmitted value = (-10,531.4 - (-30,000)) / 0.1 = 194,686

KESSEL

The calculated value is now positive and integer number. However, the value 194,686 is greater than 65,535 and thus cannot be transmitted with one register (see "Transmission of integer values", page 8).

2.1.3   Transmission of integer values

Description

As a result of the conversion in the control unit, only positive, integer values are transmitted via the ModBus's register.

If values exist that are greater than 65,535, two registers have to be used for the transmission.

The transmitted value has to be split into two parts; one part that contains the high-order 2 bytes and one that contains the low-order 2 bytes.

The value has to be converted into a hexadecimal value for this purpose.

The resulting byte sequence is then split between the registers accordingly for transmission.

Example

The value 194,686 is to be transmitted.

A register with 16 bits (maximum value 65,535) is too small for this, so that 2 registers have to be used.

Proceed as follows for the calculation and subsequent transmission by the control unit:

1. Convert to a hexadecimal value:
   - 194,686 --> 0x2F87E
2. Spit into bytes:
   - high-order bytes: 0x0002 (filled up with 0)
   - low-order bytes: 0xF87E
3. Transmit via ModBus

2.1.4   Receipt of integer values

Description

By specifying that only positive, integer values can be transmitted via the Modbus's register, those values that are received have to be converted back accordingly.

If values now exist that are greater than 65,535, two registers have to be taken into account during the reception/conversion.

The received value has to be compiled from two parts; one part that contains the high-order 2 bytes and one that contains the low-order 2 bytes.

After compilation, the value can be converted into a decimal value and used for further processing.

Example

A value is read out and received that needs 2 registers for its transmission.

The register with the lower address contains the value 0x0002.

The register with the higher address contains the value 0xF87E.

Proceed as follows for the reception and subsequent compilation:

1. Receive value of the 1st register (normally the register with the lower address):
   - 0x0002

2. Receive value of the 2nd register (normally the register with the higher address):
   - 0xF87E

3. Compile the received bytes:

high-order bytes	0x0002
low-order bytes	0xF87E

   ↓

   0x0002F87E

4. Convert the overall values into a decimal value
   - 0x0002F87E --> 194,686

2.1.5 Value calculation after receipt

Description

Since only integer, positive numerical values are transmitted, all other values have to be converted back to their original format after reception.

The values must be converted in accordance with the specified factor and offset after reception according to the following equation:

$$value = transmitted\ value * factor + offset$$

Example

In order to interpret the received value correctly, this has to be converted back to its original value after reception.

The **factor 0.1** and the **offset -30,000** shall apply for the specified value.

Value = 194,686 * 0.1 + (-30,000) = -10,531.4

The calculated value now corresponds to the original value in the control unit again (measured value, display value, etc.).

3 Register

3.1 COIL register

Description

The statuses of all of the control unit's digital outputs can be read out in the COIL registers.

These mainly include the relays to switch the various outputs.

Functions

The function code to read the COIL register is 0x01.

Register addresses

The COIL registers can be found in the address range from 00001 to 09999.

The following registers are currently used for the KESSEL control units:

- 1 - 500 (or: 00001 - 00500)
- 701 - 750 (or: 00701 - 00750)

3.1.1 COIL 00001 | Digital outputs 1

ModBus settings

Function code: **01$_H$**

Bit table

Register 00001															
Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7	Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15

				1:	Motor activated	
8	1	LIN output	LIN	0:	Relay deactivated	
				1:	Relay activated	
9 - 15	7	not used	-			

3.2 Discrete input

Description

The values of the control unit's digital inputs are compiled in the Modbus function group.

Functions

The function code to read the COIL register is 0x02.

Register addresses

The COIL registers can be found in the address range from 10001 to 19999.

The following registers are currently used for the KESSEL control units:

- 1 (or: 10001)

3.2.1 Discrete input 10001 | Digital inputs

ModBus settings

Function code: **02$_H$**

Bit table

Register 10001															
Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7	Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15

Description

Bit	Size	Designation	Short name	Values		Description
0	1	OFF input	OFF	0: 1:	no signal Signal present	Shows the status of the OFF input
1	1	ON1 input	ON1	0: 1:	no signal Signal present	Shows the status of the ON1 input
2	1	ON2 input	ON2	0: 1:	no signal Signal present	Shows the status of the ON2 input
3	1	ALARM input	ALARM	0: 1:	no signal Signal present	Shows the status of the ALARM input
4 - 15	12	not used	-			

3.3 Input register

Description

The error and status information for various control unit functions can be queried and set via the input registers.

These include the information that generally applies for the control unit as well as parameters and values for motors, pumps, flap, backwater, analogue sensors and others.

Functions

The function code to read the input register is 0x04.

Register addresses

The input registers can be found in the address range from 30001 to 39999.

The following registers are currently used for the KESSEL control units:

- 1 - 500 (or: 30001 - 30500):
  - ⇨ General data about the control unit

- 551 - 600 (or: 30551 - 30600):
  - ⇨ Parameters and values for the connected pumps and motors
- 601 - 650 (or: 30601 - 30650):
  - ⇨ Parameters and values for the flap and backwater
- 651 - 700 (or: 30551 - 30600):
  - ⇨ Parameters and values for the sensor system and water level measurement

3.3.1   INPUT 30001 | Control unit variant

The control unit variant can be read out via the input register 30001.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
1	16	Control unit variant	0	not defined	The value indicates which control unit variant is connected.
			1	Comfort Plus	
			2	FA PV	
			3	FKA	
			4	Pumpfix	
			5	EasyClean IL	

3.3.2   INPUT 30002-30004 | Firmware revision index

The revision index for the firmware can be read out via the input registers 30002-30004.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
2	16	Firmware revision high	from:	0	First digit of the firmware revision index.
			to:	655536	
3	16	Firmware revision mid	from:	0	Second digit of the firmware revision index.
			to:	655536	
4	16	Firmware revision low	from:	0	Third digit of the firmware revision index.
			to:	655536	

3.3.3   INPUT 30005 | Product type

The product type can be read out via the input register 30005.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
5	16	Product type	0	not defined	Value for product type
			1	Pumpfix Mono	
			2	Pumpfix Duo	
			3	Lifting station Mono	
			4	Lifting station Duo	
			5	Pumping station Mono	
			6	Pumping station Duo	
			7	Lifting station XXL Mono	
			8	Lifting station XXL Duo	

3.3.4 INPUT 30006 | System variant

The system variant can be read out via the input register 30006.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description

3.3.6   INPUT 30008 | Sensor configuration

The sensor configuration can be read out via the input register 30008.

__ModBus settings__   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
8	16	20 Sensor configuration	0	not defined	Value for sensor configuration
			1	Pressure sensor + optical probe	
			2	Pressure sensor + LEF probe	
			3	Pressure sensor + float switch alarm	
			4	Pressure sensor + air bubbling	
			5	Pressure sensor+ air bubbling + float switch alarm	
			6	Float switch + Alarm	
			7	Float switch without off level	
			8	Level sensor	
			9	Level probe + alarm switch	
			10	Conductivity probe	
			11	Pressure sensor	

3.3.7   INPUT 30009-30010 | Total running time

The total running time of the control unit can be read out via the input registers 30009 and 30010.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

__ModBus settings__   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
9 - 10	32	Total running time	Factor:	0.1	The value indicates the measured total running time since initial commissioning of the control unit.
			Offset:	0	
			Unit:	h	
			Range:	0h to 429496729.5h	

3.3.8   INPUT 30011-30012 | Power outage time

The power outage time of the control unit can be read out via the input registers 30011 and 30012.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

__ModBus settings__   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
11 - 12	32	Power outage time	Factor: Offset: Unit: Range:	0.1 0 h 0h to 429496729.5h	The value indicates the measured power outage time since initial commissioning of the control unit.

3.3.9 INPUT 30015 | Last maintenance

The last maintenance for the control unit can be read out via the input register 30015.

The last maintenance is output as a numerical value. 01.01.2000 is taken as the basis for the calculation.

ModBus settings   Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
15	16	Last maintenance	Factor: Offset: Unit: Range:	1 0 d 0d to 65535d	Value for last maintenance (days since 01.01.2000)

3.3.10 INPUT 30016 | Next maintenance

The next maintenance for the control unit can be read out via the input register 30016.

The next maintenance is output as a numerical value. 01.01.2000 is taken as the basis for the calculation.

ModBus settings   Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
16	16	Next maintenance	Factor: Offset: Unit: Range:	1 0 d 0 d to 65535 d	Value for next maintenance (days since 01.01.2000)

3.3.11 INPUT 30017 | Battery voltage values

The battery voltage and its threshold can be read out via the input register 30017.

The battery voltage shows the current voltage value of the battery.

The battery voltage threshold indicates the value as of which a battery error is triggered and the battery has to be changed.

ModBus settings   Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
17	8	Battery voltage	Factor: Offset: Unit: Range:	0.1 0 V 0V to 25.5V	Battery voltage value
	8	Battery voltage threshold	Factor: Offset: Unit: Range:	0.1 0 V 0 V to 25.5 V	Battery voltage threshold value

3.3.12   INPUT 30018 | Temperature

The temperature of the control unit can be read out via the input register 30018.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
18	16	Temperature	Factor: Offset: Unit: Range:	0.1 -50 °C -50 °C to 6503.5 °C	The value indicates the temperature measured at the control unit.

3.3.13   INPUT 30019 | Mains voltage L1

The mains voltage L1 of the control unit can be read out via the input register 30019.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
19	16	Mains voltage L1	Factor: Offset: Unit: Range:	1 0 V 0V to 65535V	Mains voltage L1 value

3.3.14   INPUT 30020 | Mains voltage L2

The mains voltage L2 of the control unit can be read out via the input register 30020.

ModBus settings   Function code: **04**$_H$

KESSEL

Description

Register	Size [bit]	Designation	Values		Description
20	16	Mains voltage L2	Factor: Offset: Unit: Range:	1 0 V 0 V to 65535 V	Mains voltage L2 value

3.3.15 — INPUT 30021 | Mains voltage L3

The mains voltage L3 of the control unit can be read out via the input register 30021.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
21	16	Mains voltage L3	Factor: Offset: Unit: Range:	1 0 V 0 V to 65535 V	Mains voltage L3 value

3.3.16 — INPUT 30022 | Language and power-up delay

The set language and the power-up delay can be read out via the input register 30022.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
22	8	Language	0 1 2 3 4 5 6	not defined Deutsch English French Italian Dutch Polish	Language value
	8	Power-up delay	Factor: Offset: Unit: Range:	1 0 s 0s to 255s	Power-up delay value

3.3.17 — INPUT 30024 | SDS interval

The days for the control unit's SDS interval can be read out via the input register 30024.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
24	16	SDS interval days	Factor: Offset: Unit: Range:	1 0 d 0d to 65535d	SDS interval days value

3.3.18 INPUT 30025| SDS interval time

The time of the control unit's SDS interval can be read out via the input register 30025.

The time is divided up into hours and minutes. Each of these are transmitted in 8 bit values

ModBus settings   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
25	8	SDS interval time (hours)	Factor: Offset: Unit: Range:	1 0 h 0h to 255h	SDS interval time value (hours)
	8	SDS interval time (minutes)	Factor: Offset: Unit: Range:	1 0 min 0min to 255min	SDS interval time value (minutes)

3.3.19 INPUT 30551-30552 | Run time pump 1

The run time of pump 1 can be read out via the input registers 30551 and 30552.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
551 - 552	32	Run time pump 1	Factor: Offset: Unit: Range:	0.1 0 h 0h to 429496729.5h	Run time pump 1 value

3.3.20 INPUT 30553-30554 | Operating cycles 1

The operating cycles of pump 1 can be read out via the input registers 30553 and 30554.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
553 - 554	32	Operating cycles 1	Factor:	1	Operating cycles pump 1 value
			Offset:	0	
			Unit:	x	
			Range:	0x to 4294967295x	

3.3.21   INPUT 30555-30556 | Run time pump 2

The run time of the control unit's pump 2 can be read out in the input registers 30555 and 30556.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
555 - 556	32	Run time pump 2	Factor:	0.1	Run time pump 2 value
			Offset:	0	
			Unit:	h	
			Range:	0h to 429496729.5h	

3.3.22   INPUT 30557-30558 | Operating cycles 2

The operating cycles of the control unit's pump 2 can be read out in the input registers 30557 and 30558.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
557 - 558	32	Operating cycles 2	Factor:	1	Operating cycles pump 2 value
			Offset:	0	
			Unit:	x	
			Range:	0x to 4294967295x	

3.3.23   INPUT 30559-30560 | Maximum operating cycles of pumps

The maximum operating cycles of the control unit's pumps can be read out via the input registers 30559 and 30560.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
559 - 560	32	Maximum operating cycles of pumps	Factor:	1	Maximum operating cycles pump value
			Offset:	0	
			Unit:	x	
			Range:	0x to 4294967295x	

3.3.24   INPUT 30561 | Current pump 1

The current of pump 1 can be read out via the input register 30561.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
561	16	Current pump 1	Factor:	0.1	Current pump 1 value
			Offset:	0	
			Unit:	A	
			Range:	0A to 6553.5A	

3.3.25   INPUT 30562 | Current pump 2

The current of pump 2 can be read out via the input register 30562.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
562	16	Current pump 2	Factor:	0.1	Current pump 2 value
			Offset:	0	
			Unit:	A	
			Range:	0A to 6553.5A	

3.3.26   INPUT 30563 | Maximum pump current

The maximum pump current of the control unit can be read out via the input register 30563.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
563	16	Maximum pump current	Factor:	0.1	Maximum pump current value
			Offset:	0	
			Unit:	A	
			Range:	0A to 6553.5A	

3.3.27

INPUT 30564 | Minimum pump current

The minimum pump current of the control unit can be read out via the input register 30564.

ModBus settings

Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
564	16	Minimum pump current	Factor:	0.1	Minimum pump current value
			Offset:	0	
			Unit:	A	
			Range:	0A to 6553.5A	

3.3.28

INPUT 30565 | Pump 1 on delay

The on delay of pump 1 can be read out via the input register 30565.

ModBus settings

Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
565	16	Pump 1 on delay	Factor:	1	On delay value
			Offset:	0	
			Unit:	sec	
			Range:	0sec to 65535sec	

3.3.29

INPUT 30566 | Post run time

The post run time of the control unit can be read out via the input register 30566.

ModBus settings

Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
566	16	Post run time	Factor:	1	Post run time value
			Offset:	0	
			Unit:	sec	
			Range:	0sec to 65535sec	

3.3.30

INPUT 30567 | Max. run time

The max. run time of the control unit can be read out via the input register 30567.

ModBus settings

Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
567	16	Max. run time	Factor:	1	Max. run time value
			Offset:	0	
			Unit:	min	
			Range:	0min to 65535min	

3.3.31 INPUT 30568 | Max. number of runs

The max. number of runs of the control unit can be read out via the input register 30568.

ModBus settings

Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
568	16	Max. number of runs	Factor:	1	Max. number of runs value
			Offset:	0	
			Unit:	A	
			Range:	0A to 65535A	

3.3.32 INPUT 30569-30570 | Energy usage pumps

The calculated energy usage of the control unit's pumps can be read out via the input registers 30569 and 30570.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings

Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
569 - 570	32	Energy usage pumps	Factor:	0.1	Energy usage pump value
			Offset:	0	
			Unit:	kWh	
			Range:	0kWh to 429496729.5kWh	

3.3.33 INPUT 30601-30602 | Backwater phase

The total backwater phase of the control unit can be read out via the input registers 30601 and 30602.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings

Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
601 - 602	32	Backwater phase	Factor:	0.1	Total backwater phase value
			Offset:	0	
			Unit:	h	
			Range:	0h to 429496729.5h	

3.3.34 INPUT 30603-30604 | Backwater occurrences

The total backwater occurrences for the control unit can be read out via the input registers 30603 and 30604.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings

Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
603 - 604	32	Backwater occurrences	Factor:	1	Total backwater phase of control unit value
			Offset:	0	
			Unit:	x	
			Range:	0x to 4294967295x	

3.3.35 INPUT 30605-30606 | Flap operating cycles

The flap operating cycles of the control unit can be read out via the input registers 30605 and 30606.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings

Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
605 - 606	32	Flap operating cycles	Factor:	1	Flap operating cycles value
			Offset:	0	
			Unit:	x	
			Range:	0x to 4294967295x	

3.3.36 INPUT 30607-30608 | Maximum flap operating cycles

The max. operating cycles of the control unit's flap can be read out via the input registers 30607 and 30608.

Two registers have to be used for the output because the value range (maximum value) is too high for one register.

ModBus settings

Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
607 - 608	32	Maximum flap operating cycles	Factor:	1	Maximum flap operating cycles value
			Offset:	0	
			Unit:	x	
			Range:	0x to 4294967295x	

3.3.37   INPUT 30609 | Flap current

The flap current of the control unit can be read out via the input register 30609.

ModBus settings   Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
609	16	Flap current	Factor:	1	Flap current value
			Offset:	0	
			Unit:	mA	
			Range:	0mA to 65535mA	

3.3.38   INPUT 30610 | Maximum flap current

The max. flap current of the control unit can be read out via the input register 30610.

ModBus settings   Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
609	16	Maximum flap current	Factor:	1	Max. flap current value
			Offset:	0	
			Unit:	mA	
			Range:	0mA to 65535mA	

3.3.39   INPUT 30611 | On delay flap

The on delay of the control unit's flap can be read out via the input register 30611.

ModBus settings   Function code: **04**H

Description

Register	Size [bit]	Designation	Values		Description
611	16	On delay flap	Factor:	1	On delay flap value
			Offset:	0	
			Unit:	s	
			Range:	0s to 65535s	

3.3.40 INPUT 30612 | Post run time flap

The post run time of the control unit's flap can be read out via the input register 30612.

ModBus settings

Function code: **04**ₕ

Description

Register	Size [bit]	Designation	Values		Description
610	16	Post run time flap	Factor:	1	Post run time flap value
			Offset:	0	
			Unit:	s	
			Range:	0s to 65535s	

3.3.41 INPUT 30651 | Air bubbling offset

The air bubbling offset for the control unit's pressure sensor can be read out via the input register 30651.

ModBus settings

Function code: **04**ₕ

Description

Register	Size [bit]	Designation	Values		Description
651	16	Air bubbling offset	Factor:	1	Pressure sensor's air bubbling offset value
			Offset:	0	
			Unit:	mm	
			Range:	0 mm to 65535 mm	

3.3.42 INPUT 30652 | Sensor height

The height of the pressure sensor can be read out via the input register 30652.

ModBus settings

Function code: **04**ₕ

Description

Register	Size [bit]	Designation	Values		Description
652	16	Sensor height	Factor:	1	Pressure sensor height value
			Offset:	0	
			Unit:	mm	
			Range:	0 mm to 65535 mm	

3.3.43 INPUT 30653 | Sensing zone level sensor

The pre-set sensing zone for the level sensor can be read out via the input register 30653.

ModBus settings

Function code: **04**ₕ

Description

Register	Size [bit]	Designation	Values		Description
653	16	Sensing zone level sensor	Factor: Offset: Unit: Range:	1 0 x 0x to 65535x	Sensing zone for the level sensor value

3.3.44   INPUT 30654 | OFF 1 - level

The OFF 1 level to switch off pumping can be read out via the input register 30654.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
654	16	OFF 1 - level	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 65535 mm	OFF 1 level to switch off pumping value

3.3.45   INPUT 30655 | OFF 2 - level

The OFF 2 level to switch off the 2nd pump can be read out via the input register 30655.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
655	16	OFF 2 - level	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 65535 mm	OFF 2 level to switch off the 2nd pump

3.3.46   INPUT 30656 | ON 1 - level

The ON 1 level to start pumping can be read out via the input register 30656.

ModBus settings   Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
656	16	ON 1 - level	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 65535 mm	ON 1 level to start pumping value

3.3.47   INPUT 30657 | ON 2 - level

The ON 2 level to switch on the 2nd pump can be read out via the input register 30657.

ModBus settings   Function code: **04**_H

Function code: 04_H

Description

Register	Size [bit]	Designation	Values		Description
65/	16	ON 2 - level	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 65535 mm	ON 2 level to switch on the 2nd pump

3.3.48   INPUT 30658 | Alarm level

The alarm level can be read out via the input register 30658.

ModBus settings   Function code: 04_H

Description

Register	Size [bit]	Designation	Values		Description
658	16	Alarm level	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 65535 mm	ALARM level value

3.3.49   INPUT 30659 | Optical probe

The values for the optical probe can be read out via the input register 30659.

The register is split into 2 ranges with 8 bits each. The error detection time and logic time for the optical probe can be read out. The logic time indicates the response time of the optical probe.

ModBus settings   Function code: 04_H

Description

Register	Size [bit]	Designation	Values		Description
659	8	Error detection time optical probe	Factor: Offset: Unit: Range:	1 0 s 0s to 255s	Error detection time optical probe value
	8	Logic time optical probe	Factor: Offset: Unit: Range:	1 0 s 0s to 255s	Logic time optical probe value

3.3.50 INPUT 30660 | Temperature drift

The temperature drift for the control unit's pressure sensor can be read out via the input register 30660.

ModBus settings

Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
660	16	Temperature drift	Factor: Offset: Unit: Range:	1 0 % 0% to 65535%	Pressure sensor temperature drift value

3.3.51 INPUT 30661 | Pressure error threshold

The threshold as of which the pressure error is triggered can be read out via the input register 30661.

The register is divided into 2 ranges with 8 bits each. The 1st range contains the value for the pressure error threshold. The 2nd range is not currently in use.

ModBus settings

Function code: **04**$_H$

Description

Regis-ter	Size [bit]	Designation	Values		Description
661	8	Pressure error threshold	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 255 mm	Pressure error threshold value
	8	not used	-		

3.3.52 INPUT 30662 | Offset pressure sensor

The offset for the pressure sensor can be read out via the input register 30662.

ModBus settings

Function code: **04**$_H$

Description

Register	Size [bit]	Designation	Values		Description
662	16	Offset pressure sensor	Factor: Offset: Unit: Range:	1 -10000 mm -10000 mm to 55535 mm	Pressure sensor offset value

KESSEL

3.3.53   INPUT 30663 | Delay pressure drop routine

The delay for the pressure drop routine can be read out via the input register 30663.

ModBus settings   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
663	16	Delay pressure drop routine	Factor: Offset: Unit: Range:	1 0 s 0s to 65535s	Pressure drop routine delay value

3.3.54   INPUT 30664 | Current level

The current water level in the system's tank can be read out via the input register 30664.

ModBus settings   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
664	16	Current level	Factor: Offset: Unit: Range:	1 0 mm 0 mm to 65535 mm	Current (water) level in tank value

3.3.55   INPUT 30665 | LP-constant 1

The LP-constant 1 (low-pass constant 1) to filter the pressure sensor signal can be read out via the input register 30665.

ModBus settings   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
665	16	LP-constant 1	Factor: Offset: Unit: Range:	1 0 x 0x to 65535x	LP-constant 1 of the pressure sensor signal value

3.3.56   INPUT 30666 | LP-constant 2

The LP-constant 2 (low-pass constant 2) to filter the pressure sensor signal can be read out via the input register 30666.

ModBus settings   Function code: **04**_H

Description

Register	Size [bit]	Designation	Values		Description
666	16	LP-constant 2	Factor:	1	LP-constant 2 of the pressure sensor signal value
			Offset:	0	
			Unit:	x	
			Range:	0x to 65535x	

3.4 Holding register

Description

The error and status information for various control unit functions can be queried via the holding registers.

These include the information that generally applies for the control unit as well as status values for motors, pumps, flap, backwater and others.

Functions

The function code to read the holding register is 0x03.

Register addresses

The holding registers can be found in the address range from 40001 to 49999.

The following registers are currently used for the KESSEL control units:

- 1 - 500 (or: 40001 - 40500):
  - ⇨ General data about the control unit
- 501 - 550 (or: 40501 - 40550):
  - ⇨ Error and status display for the control unit communication
- 551 - 600 (or: 40551 - 40600):
  - ⇨ Error and status display for the connected pumps and motors
- 601 - 650 (or: 40601 - 40650):
  - ⇨ Error and status display for the flap and backwater

3.4.1 HOLDING 40001 | General status and errors

ModBus settings

Function code: **03**$_H$
